DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 2/20/2008 has been entered.

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 34, 37, 46, 53 and 60-61 are rejected under 35 U.S.C. 103(a) as being unpatentable over Egawa (U.S. Pat. 6229215) in view of Buckley, III et al. (U.S. Pat. 5477082).

Regarding claims 34 and 53, Egawa et al. disclose a semiconductor device (fig. 4) comprising:

a BGA (ball grid array) type semiconductor device including a base plate 30 and a plurality of bumps 15 formed on a backside surface of the base plate; and

a CSP (chip size packaged) type semiconductor device mounted on an area of the backside surface of the base plate 30 of the BGA type semiconductor device which does not have the plurality of bumps formed thereon,

the CSP type semiconductor device having a semiconductor element 17 which has main and back surface, and side surfaces between the main and back surfaces, and a plurality of terminals 18 which are formed on the main surface,

wherein the back surface and the entirety of the side surfaces of the semiconductor element 17 are exposed,

the CSP type semiconductor device as mounted on the backside surface of the base plate 30 has a thickness less than a thickness of plurality of bumps 15, and

wherein the CSP type semiconductor device has a resin 33 that covers the main surface of the semiconductor element 17 and side surfaces of the terminals 18 (fig. 4).

Egawa et al. do not disclose a printed circuit board via the plurality of bumps.

However, Buckley, III et al. disclose a semiconductor device (cover fig.) comprising: a base plate 60 and a plurality of bumps 54 formed on the base plate 60, wherein the backside surface of the base plate 60 is mounted to a printed circuit board 52 (column 3, line 33) via the plurality of bumps 54 (cover fig.).

As Buckley, III et al. disclose, one of ordinary skill in the art would have been motivated to form a printed circuit board is mounted to the backside surface of the base plate via the plurality of bumps in order to provide a electrical connection for the plurality of bumps and different application for the semiconductor package (cover fig.).

Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to form a printed circuit board is mounted to the backside surface of the base plate via the plurality of bumps as taught by Buckley, III et al. into the device of Egawa et al. in order to provide a electrical connection for the plurality of bumps and different application for the semiconductor package (cover fig.).

Regarding claim 37, Egawa discloses that the CSP type semiconductor device is mounted on the BGA type semiconductor device so that a front surface of the CSP type semiconductor device faces the backside surface of the base plate 30 (fig. 4).

Regarding claim 46, Egawa et al. disclose that wherein the main surface of the semiconductor element 17 faces the backside surface of the base plate 30 (fig. 4).

Regarding claims 57 and 60, it would have been obvious to one having ordinary skill in the art to have a size of the semiconductor element of the BGA type semiconductor device is smaller than a size of the semiconductor element of the CSP type semiconductor device. Note *Inaba et al. (fig. 9)* is cited to support for the well known position.

Regarding claim 58, Egawa et al. disclose that wherein the BGA type semiconductor device and the CSP type semiconductor deice are individually manufactured.

Regarding claims 59 and 61, Egawa et al. disclose that wherein the BGA type semiconductor device has a semiconductor element 11 which has a thickness greater than a thickness of the semiconductor element 17 of the CSP type semiconductor device (fig. 4).

3. Claims 35-36 and 54-56 are rejected under 35 U.S.C. 103(a) as being unpatentable over Egawa (U.S. Pat. 6229215) in view of Buckley, III et al. (U.S. Pat. 5477082) as applied to claims 34 and 53 above, and further in view of Lin et al. (U.S. 5239198).

Regarding claims 35 and 54, as discussed in details above, Egawa and Buckley, III et al. substantially disclose all the limitations as claimed above except for a plurality of conductive portions on the backside surface of the base plate, the semiconductor device further comprising a plurality of conductive members, each of which is located between a corresponding one of the plurality of conductive portions and the portion of a corresponding one of the plurality of terminals.

However, Lin et al. disclose a semiconductor device comprising: a plurality of conductive portions 42 (fig. 5, column 6, lines 33-34) on the backside surface of the base plate 12, the semiconductor device further comprising a plurality of conductive members 16, each of which is located between a corresponding one of the plurality of conductive portions and the portion of a corresponding one of the plurality of terminals 51 (fig. 6).

As Lin et al. disclose, one of ordinary skill in the art would have been motivated to form a plurality of conductive portions on the backside surface of the base plate, the semiconductor device further comprising a plurality of conductive members, each of which is located between a corresponding one of the plurality of conductive portions and the portion of a corresponding one of the plurality of terminals in order to provide external electrical connections to the device (fig. 6).

Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the device of Egawa and Buckley, III et al. by having a plurality of conductive portions on the backside surface of the base plate, the semiconductor device further comprising a plurality of conductive members, each of which is located between a corresponding one of the plurality of conductive portions and the portion of a corresponding one of the plurality of terminals as taught by Lin et al., such a plurality of conductive portions and conductive members would provide external electrical connections to the device (fig. 6).

Regarding claim 36, Egawa et al. disclose that wherein the plurality of terminals 18 of the CSP type semiconductor device 17 are coupled to the wiring patterns via solder joints (fig. 4, column 5, lines 35-41).

Regarding claim 55, Lin et al. disclose that the conductive members 16 are not sealed with the resin (fig. 6).

Regarding claim 56, Line et al. disclose that the conductive portions 42 are solder (column 6, lines 33-34).

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to DILINH NGUYEN whose telephone number is (571)272-1712. The examiner can normally be reached on 8:00AM - 5:00PM (M-F).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wael Fahmy can be reached on (571) 272-1705. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
